

# Report Lab 1: Radio Engineering

Henning Schei

March 2016

## 1 Task 1

Since the lowest RX-sensitivity level is -97 dBm, the maximum receiver noise figure that will give a SNR of 0 dB is -97 dBm.

## 2 Task 2

The figure[1] shows the difference between the horizontal and vertical polarization. The reason why the horizontal wave is stronger may be the fact that the vertical wave are being attenuated by the surface. Since sea is not a smooth surface, it will be scattered and attenuated.

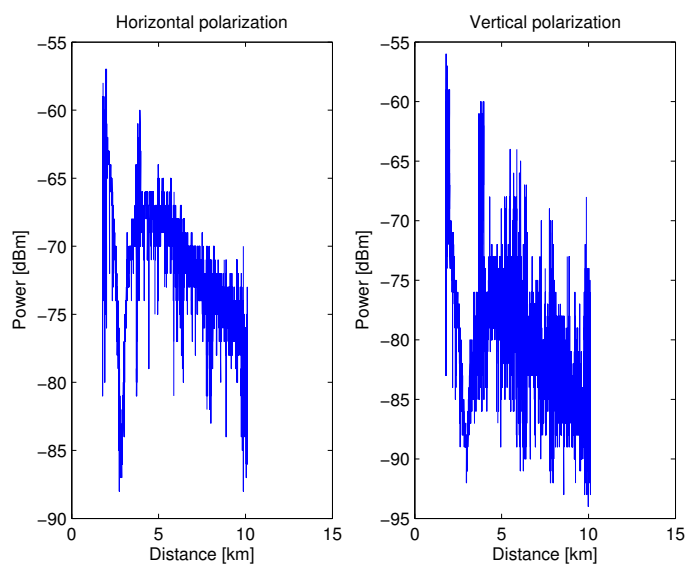

Figure 1: Measurement data of vertical and horizontal polarization.

### 3 Task 3

The model does fit the data very well. The characteristic dip in the curve are also very accurate As the model approaches zero when the arguments in the sine and cosine approaches  $2\pi$  the mearsurement data does the same.

Figure 2: Measurment data of vertical, horizontal polartization and the two path model from appendix. blue = horizontal, green = vertical

### 4 Task 4

The maximum range of a cell highest MCS  $d = 3.6520e + 04$ . xxx for lowest MCS
